Abstract:

With the rapid development of digital technology and new media technology, virtual culture has received widespread attention. As an emerging cultural phenomenon, virtual idols are changing the pattern of the traditional entertainment industry. However, the development of the virtual industry is still unstable, and there are still many shortcomings. This article explores the rise of virtual idols in the new media environment and their impact on communication mechanisms, providing a new perspective for understanding cultural communication in the new media era and guiding the healthy development of the virtual idol industry. The study analyzed the definition, development process, and dissemination characteristics of virtual idols in the new media environment, revealing the challenges faced by the virtual idol industry, such as infringement, content homogenization, single market operation mode, privacy protection, and technological bottlenecks. Corresponding countermeasures and suggestions were proposed to strengthen industry norms and protection, innovate content and technology, enhance supervision and protection, and seek more profitable models.

Keywords: New media; virtual idols; dissemination mechanism; digital technology; cultural communication

1. Introduction

With the rapid development of Internet technology, the new media environment presents the characteristics of diversification, personalization, immediacy, and interactivity. With the rise of new media forms such as social media and short video platforms,

breaking the monopoly of traditional media on information dissemination and giving the public more voice and participation, virtual idols, as a product of the new media era, have gradually become highly favored in the cultural and entertainment fields due to their unique charm and communication advantages [1]. Virtual idols, with their unique communication

mechanism, bring new entertainment experiences to the public and have a profound impact on the contemporary social and cultural ecology and communication patterns. The development process of virtual idols can be traced back to the late 20th and early 21st centuries. With the continuous progress of technologies such as computer graphics and speech synthesis, virtual idols have gradually transformed from concepts to reality. In recent years, with the integration and application of 5G, AI, VR/AR, and other technologies, the production and dissemination costs of virtual idols have dropped significantly, and their influence is expanding. The success of virtual idols such as Luo Tianyi and Hatsune Miku has proved that the virtual idol market has great potential [2]. Not only that, it has also aroused widespread attention in the academic community to the dissemination mechanism of virtual idols, and related research has gradually increased. Scholars in the fields of communication, sociology, and cultural studies have explored the phenomenon of virtual idols from different perspectives. Existing research mainly focuses on the technological implementation, fan culture, business models, and other aspects of virtual idols, as well as their dissemination value and industrial applications. Lin Maocong and Huang Yue analyze the construction strategy and significance of virtual idol IP based on visual design analysis. They believe that the research on virtual idols should not be limited only to the level of technology and cognitive existence. Visual style and overall planning are important ways to achieve commercial value, and can empower the overall presentation of virtual digital humans through shaping stylized character identities and strategic operations [3]. Li Yaning and Wang Jingyang deepen the driving factors of virtual idol image consumption from the perspective of consumer behavior. Wang Jingyang believes that virtual idols provide a special type of “image consumption” as a new type of cultural commodity [4]. While Li Yaning points out that virtual idols represented by Luo Tianyi utilize the interaction mechanism between fans and form a new cultural empowerment phenomenon on online social platforms. This new form has not only achieved great business success, but also meets people’s growing spiritual and cultural needs [5]. However, there is a relative lack of research on the dissemination mechanism and social impact of virtual idols in the new media environment. This study attempts to fill this gap and deeply analyze the dissemination characteristics and impact mechanism of virtual idols in the new media environment. Aim to explore in depth the innovative communication mechanism of virtual idols in the new media environment, analyze the problems and challenges they face, and provide corresponding response strategies. As a new type of cultural communication carrier, virtu-

al idols have a different dissemination mechanism from traditional celebrity idols. Studying this phenomenon can provide new perspectives and cases for the development of communication theory. Analyzing the dissemination mechanism of virtual idols can help find the dissemination rules of the new media era and provide theoretical support and practical guidance for the innovative development of the cultural and entertainment industry. This study can also enrich the theoretical framework of digital culture and fan culture research, providing a reference for academic research in related fields.

2. The Influence and Dissemination Mechanism of Virtual Idols

2.1 The Development and Influence of Virtual Idols

Virtual idols are digital images with human characteristics created through computer technology. These images interact with audiences through music, live streaming, and social media, and have their own fan base and commercial value. The development of virtual idols has gone through several stages: the early virtual singer image Hatsune Miku, in which the future mainly depends on voice synthesis technology, and the second generation virtual idol, such as Love Live! Adding rich and diverse character settings and story backgrounds, current virtual idols such as Luo Tianyi from China and Kizuna AI from Japan have integrated artificial intelligence and real-time motion capture technology to achieve a higher level of interactivity. Communication scholar Yu Guoming believes that virtual idols are a type of virtual, similar to the behavior of idols in the virtual environment of the internet [6]. Virtual idols, with their unique charm and advantages in dissemination, have had a profound impact on contemporary society. Virtual idols, through personalized design of external features such as appearance and character design, can bring sensory and cognitive impact to users during the dissemination process [7]. Virtual idols enrich cultural and entertainment forms in the cultural field, providing the public with a new aesthetic experience. Virtual idols have created significant commercial value in the commercial field through brand endorsements, live streaming sales, and other means. At the social level, virtual idols have become a key topic of communication and interaction among fans, enhancing their cohesion and sense of belonging. In short, the virtual idol currently refers to a combination of personal design, technology, and operation [8].

Data shows that a certain virtual anchor has been live streaming for an average of 6 hours and 45 minutes in

the past 30 days, almost every day, with an average of 74.8 million viewers per session, 77.3 million viewers per day, and a total of 2243 viewers. It can be seen that daily broadcasting can form user habits and strengthen the continuous output of cultural content. Daily scheduled interaction and communication with virtual hosts in the live broadcast room, where fans receive emotional value and hosts receive corresponding rewards and profits. The immersive experience and emotional resonance provided by virtual idols have brought unprecedented interactive experiences to fans [9]. Not only that, its 2024 video Interaction per thousand followers (IPM) is 77.51, reaching 54.78 since 2025. Users can participate in cultural dissemination through bullet comments and gifts, enhancing their sense of immersion. Long-term live streaming can establish an emotional bond between hosts and users, promoting cultural identity. This high level of interactivity enhances fans' sense of participation and belonging, promoting the dissemination and exchange of culture.

Regarding the dissemination of cultural effects, virtual idols have attracted audiences of different ages, genders, and regions with their unique charm and innovative communication methods, covering users of different ages in different regions and promoting niche culture to the public.

Moreover, virtual idols have broken through the image limitations of traditional idols and can be personalized designed according to the needs of cultural dissemination. Virtual idols are more in line with the characters and aesthetics of fans when watching novels, comics, or anime. They can integrate various cultural elements to create unique visual images. That is to say, virtual idols can be accurately positioned and marketed according to the interests, hobbies, and cultural needs pursued by target consumers, to meet the needs of different groups of people for virtual idols.

2.2 Characteristics and Mechanisms of Communication in the New Media Environment

In the new media environment, the dissemination of virtual idols presents some prominent characteristics, one of which is decentralized dissemination. Fans are not only consumers of content, but also producers and disseminators, using secondary creation to expand their influence. The second is cross-platform interaction. Virtual Idol operates simultaneously on many platforms, such as Station B, Tiktok and Weibo, forming a matrix communication. The third is real-time interactivity, which utilizes live streaming, bullet comments, and other forms to establish an instant connection between virtual idols and fans, strengthening emotional bonds. Finally, it is data-driven,

where the operator continuously optimizes content and interaction strategies based on the analysis of user data.

The dissemination mechanism of virtual idols mainly involves three aspects: content production, channel distribution, and user interaction. In the field of content production, the production team of virtual idols will carefully plan and create attractive and communicative virtual idol images. At the channel distribution level, virtual idols use new media channels such as social media and short video platforms to spread widely and expand their influence. As for user interaction, virtual idols rely on live streaming, comments, and other forms of real-time interaction with fans to enhance their sense of participation and loyalty.

3. The Problems and Challenges in the Development of Virtual Idols

3.1 Copyright Protection and Infringement Issues

The copyright issues faced by the virtual idol industry are quite complex. On the one hand, due to weak awareness of copyright protection and low infringement costs, the copyright protection of virtual idols faces many challenges, even involving multiple rights holders. On the other hand, fan-generated secondary creations, while expanding their influence, can also lead to copyright disputes. Ethical issues cannot be ignored, such as the impact of virtual idols on the values of young people, the blurring of the boundary between virtual and reality, and the possibility of cultural appropriation or gender stereotypes in the setting of some virtual idols. This requires the entire industry to reflect and regulate. Even some criminals illegally profit by stealing elements such as the image and voice of virtual idols, seriously damaging the legitimate rights and interests of virtual idol creators.

3.2 Technical Bottlenecks and Operational Challenges

Despite rapid technological progress, the development of virtual idols still faces technical limitations, and real-time rendering technology requires high hardware requirements, which, to some extent, limits the widespread popularity of virtual idols. The application of technologies such as motion capture, 3D modeling, and AI speech synthesis requires significant investment and the support of professional talents. However, artificial intelligence still has shortcomings in the field of natural interaction, which will have an impact on user experience. At the operational level, the long-term IP maintenance cost of virtual idols is high, and content innovation faces significant pressure.

Professional teams are needed to manage fan groups and community operations. The commercialization path of virtual idols is still in the exploratory stage, and balancing artistic and commercial aspects is a major challenge.

3.3 Content Homogenization and Uneven Quality

With the continuous expansion of the virtual idol market, more companies and individuals have flooded into this field, resulting in a serious homogenization of virtual idol content. Due to the lack of effective supervision and review mechanisms, the content quality of virtual idols shows an uneven trend. Some virtual idols contain vulgar, violent, and other harmful elements, which hurt the physical and mental health of young people.

3.4 User Privacy and Data Security Issues

In the process of spreading virtual idols, there will be a lot of collection and processing of user data involved. However, some enterprises and platforms have some loopholes in user privacy protection and data security, which lead to frequent incidents of user privacy breaches and data security incidents. This situation has caused damage to the legitimate rights and interests of users and has also had an impact on the healthy development of the virtual idol industry.

3.5 Intense Market Competition and Single Profit Model

The continuous expansion of the virtual idol market has made market competition increasingly fierce. Some companies and platforms are willing to use low price competition, malicious speculation, and other means to compete for market share and user resources. The profit model of virtual idols is relatively simple, mainly relying on brand endorsement, live streaming rewards, and other channels. Such a single profit model limits the development space of the virtual idol industry and also increases the operational risks of enterprises.

4. Countermeasures and Suggestions

4.1 Strengthen Industry Standards and Copyright Protection

In terms of copyright, it is necessary to establish a copyright protection mechanism for the virtual idol industry, clearly defining the ownership of rights and usage norms of all parties. The government and enterprises should work together to strengthen copyright protection. The government should improve relevant laws, regulations,

and policy measures, carefully formulate special regulations, and increase the crackdown on infringement. Enterprises should raise awareness of copyright protection, actively apply for relevant copyright and patent protection, and strengthen industry self-discipline and cooperation to jointly ensure the healthy development of the virtual idol industry.

4.2 Technological Innovation and Content Optimization

Virtual idols, as a product of digital technology and artificial intelligence, have provided new media forms for new media communication, and virtual digital humans have benefited from the rapid development of multiple basic technologies [10]. In terms of technology, it is necessary to increase research and development investment in key technologies such as real-time rendering and artificial intelligence, lower the threshold for technology, strengthen motion capture, holographic projection, AI speech synthesis and other technologies, achieve highly realistic virtual images and interactive experiences, and allow fans to participate in a more immersive way [11]. This technology empowers the interactivity of communication and expands the boundaries of communication, allowing virtual idols to break through the limitations of traditional media and enter emerging platforms such as the metaverse. It should encourage cooperation between industry, academia, and research to promote technological innovation and the transformation of achievements. Regarding content, it is recommended that operators attach importance to the long-term value construction of virtual idols, prevent excessive commercialization, strengthen content creativity, develop culturally profound character settings and story backgrounds, establish a professional fan operation team, and maintain a healthy fan culture.

4.3 Strengthen Content Innovation and Quality Supervision

In response to the homogenization and uneven quality of virtual idol content, enterprises and platforms need to strengthen content innovation and do a good job in quality supervision. On the one hand, they need to introduce outstanding content creation teams and talents to improve the content quality and creative level of virtual idols. On the other hand, they need to establish a sound content review and supervision mechanism, strictly control and punish vulgar, violent, and other harmful content. In the new media environment, the content production of virtual idols should no longer be limited to a single music or performance form, but can integrate multiple media forms, such as short videos, live broadcasts, virtual concerts,

cross-media narratives, etc. This flexibility allows virtual idols to more accurately meet the needs of different audiences. Among the Z generation, they prefer participatory content and highly interactive forms of communication.

4.4 Ensure User Privacy and Data Security

Enterprises and platforms need to address issues related to user privacy and data security by establishing comprehensive mechanisms for user privacy protection and data security, strengthening measures for data encryption and storage security, in order to prevent the leakage and abuse of user data. In addition, the platform needs to strengthen education and guidance for users, enhance their awareness of and importance of privacy protection and data security.

4.5 Expanding Profit Models and Enhancing Market Competitiveness

In the face of a single profit model and fierce market competition for virtual idols, firstly, enterprises and platforms need to actively explore diversified profit models. In addition to brand endorsement and live streaming rewards, they can also explore various profit channels such as virtual idol derivative development, IP authorization, and offline activities. Secondly, virtual idols can be monetized through virtual concerts, brand collaborations, virtual image design, and even through the extension and development of virtual idol IP, such as virtual clothing, virtual props, etc., to expand commercial value, strengthen brand building, and increase market promotion efforts, enhancing the brand influence and market competitiveness of virtual idols. In the construction of virtual idols, practitioners need to adopt a communication strategy of staggered operation. In addition to creating a more personalized image, it can also attract fan groups from different platforms [12].

5. Conclusion

The new media environment has provided various channels for the dissemination of virtual idols. The new media environment provides virtual idols with the platform to publish works, hold online concerts, and interact with fans, achieving multi-dimensional and multi-level cultural dissemination through various channels. With the help of artificial intelligence technology and social media platforms, virtual idols can respond in real-time to fans' comments and engage in activities such as voice chat and game interaction with fans. The real-time and interactive nature of live streaming can quickly reach a massive user base, making it suitable for spreading popular cultural

content. For fans, virtual idols are not only entertainment objects but also symbols of their emotional attachment and cultural identity.

Virtual idols bring about cultural identity, "breaking circles" effect, and "long tail effect" in cultural dissemination, but at the same time, they also face many challenges, such as technology dependence risks, uneven content quality, incomplete legal supervision, limitations in cultural dissemination, and other related issues that still need further research and solutions. Among them, in response to the limitations of virtual idols, it can deepen user stickiness, analyze and adjust cultural dissemination direction based on user profile data, optimize content design according to audience interests, and optimize cultural dissemination paths.
